

Final Values-led Problem Statement

Many people, particularly those in underserved and low-resource communities, rely on online sources or AI chatbots for medical information because professional healthcare may be costly, unavailable, or difficult to access. Unfortunately, general-purpose AI systems can generate inaccurate, outdated, or unsupported health information, which may lead to poor decisions and potentially harmful outcomes. Our project aims to address this challenge by developing a trustworthy AI assistant that provides evidence-based medical information grounded in reliable clinical sources while clearly communicating its limitations and encouraging consultation with qualified healthcare professionals when appropriate. Our work will be guided by the values of **Scientific Rationalism**, **Universalism** and **Liberty**. We hope to improve access to reliable health information, reduce the spread of medical misinformation, and support more informed health decisions without replacing professional medical care.
